this project is about controlling the speed of dc servo motor by using proportional integral derivative pid algorithm then implemented on peripheral interface circuit pic microcontroller the main objective of this project is to control the speed of dc servo motor at the demanded speed or to drive the motor at that speed the speed of a dc motor usually is directly proportional to the supply voltage so if we reduce the supply voltage from 12 volts to 6 volts the motor will run at half the speed it could be achieved by simply adjusting the voltage sent to the motor but this is quite inefficient to do so a pid controller becomes the best way to overcome this problem pid attempts to correct the error between a measured process variable and a desired setpoint by calculating and then outputting a corrective action that can adjust the process accordingly in this project the pid algorithm that is added to the system becomes a closed loop system a simulation using matlab software is implemented to tune pid algorithm by changing the value of proportional gain k_p integral gain k_i and derivative gain k_d to get a speed of the motor which is less overshoot and increase settling time then a pic microcontroller is programmed by adding the value of tuned pid algorithm to control the speed of dc servo motor at the end of the project the speed of the dc servo motor should be maintain even the supply voltage is varied

the proportional integral derivative pid controllers are widely used in many industrial control systems for several decades since ziegler and nichols proposed their first

pid tuning method this is because the pid controller structure is simple and its principle is easier to understand than most other advanced controllers on the other hand the general performance of pid controller is satisfactory in many applications for these reasons the majority of the controllers used in industry are of pi pid type pid controllers are widely used for process control applications requiring very precise and accurate control the purpose of the motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed the controller does not actually measure the speed of the motor thus it is called an open loop speed controller motors come in a variety of forms and the speed controller s motor drive output will be different dependent on these forms the speed controller presented here is designed to drive special dc motor which is not easily available anywhere in store thus it is a good example to be used due to the special characteristics and parameters matlab simulink is an important tool used in this project from designing the mathematical model of the dc motor obtaining the transfer function and designing the pid controller using both model and programming using m files the transfer function will be linearized and used for tuning the gain of pid controller like k_p k_i and k_d simulink is chosen to simulate the performance of the control system
