the structure of quantum theory permits interference of indistinguishable paths at the same time however it also limits such interference to certain orders and any higher order interference is prohibited this thesis develops and studies concepts to test quantum theory with higher order interference using many particle correlations the latter being generally richer and typically more subtle than single particle correlations it is demonstrated that quantum theory in general allows for interference up to order $2m$ in m particle correlations depending on the mutual coherence of the particles however the related interference hierarchy can terminate earlier in this thesis we show that mutually coherent particles can exhibit interference of the highest orders allowed we further demonstrate that interference of mutually incoherent particles truncates already at order $m - 1$ although interference of the latter is principally more multifaceted than their coherent counterpart we introduce two families of many particle sorokin parameters whose members are expected to be all zero when quantum mechanics holds as proof of concept we demonstrate the disparate vanishing of such higher order interference terms as a function of coherence in experiments with mutually coherent and incoherent sources finally we investigate the influence of exotic kinked or looped quantum paths which are permitted by feynman s path integral approach in such setups
