feedback circuits in general and op amp applications which embody feedback principles in particular play a central role in modern electronic engineering this importance is reflected in the undergraduate curriculum where it is common practice for first year undergraduates to be taught the principles of these subjects it is right therefore that one of the tutorial guides in electronic engineering be devoted to feedback circuits and op amps often general feedback circuit principles are taught before passing on to op amps and the order of the chapters reflects this it is equally valid to teach op amps first a feature of the guide is that it has been written to allow this approach to be followed by deferring the study of chapters 2 4 and 5 until the end a second feature of the guide is the treatment of loading effects in feedback circuits contained in chapter 5 loading effects are significant in many feedback circuits and yet they are not dealt with fully in many texts prerequisite knowledge for a successful use of the guide has been kept to a minimum a knowledge of elementary circuit theory is assumed and an understanding of basic transistor circuits would be useful for some of the feedback circuit examples

as an area of statistical application environmental epidemiology and more specifically the estimation of health risk associated with the exposure to environmental agents has led to the development of several statistical methods and software that can then be applied to other scientific areas the statistical analyses aimed at addressing questions in environmental epidemiology have the following characteristics often the signal to noise ratio in the data is low and the targets of inference are inherently small risks these constraints typically lead to the development and use of more sophisticated and potentially less transparent statistical models and the integration of large high dimensional databases new technologies and the widespread availability of powerful computing are also adding to the complexities of scientific investigation by allowing researchers to fit large numbers of models and search over many sets of variables as the number of variables measured

increases so do the degrees of freedom for in uencing the association between a risk factor and an outcome of interest we have written this book in part to describe our experiences developing and applying statistical methods for the estimation for air pollution health e ects our experience has convinced us that the application of modern s tistical methodology in a reproducible manner can bring to bear subst tial bene ts to policy makers and scientists in this area we believe that the methods described in this book are applicable to other areas of environmental epidemiology particularly those areas involving spatial temporal exposures
